PROJECT

Human Action Recognition

We developed a project to recognize various actions of a human. The real-time use case of this project is to monitor unusual, repetitive, and other actions of patients. Here we are using an optimised framework by designing hybrid DNN architecture. It consists of 4 stages. They are creating data sets, design of DNN architecture, training and optimisation phase, and evaluation phase. Human Action Recognition is classified into 2 groups, Video based recognition and sensor based recognition. We are a group of 3. My role in my project is as a frontend developer. Programming language used here is python to recognise the action.

ADDITIONAL

I will be a good team member and also can be a team leader.
